PROFESSIONAL SUMMARY

Sole Software Engineer at Al-Monafiss Stores (Monafiss), where I built and run the entire platform — a NestJS and Prisma backend of 72 modules over 105 data models serving five mobile apps and an operations dashboard, carrying 750-1,000 grocery orders a day at an average basket of SAR 177.89. Skilled in Flutter for cross-platform development and in backend work with NestJS, React, and SQL. Proven ability to deliver complete, real-world systems end to end — from automated ERP synchronization and accounting, HR and payroll modules to warehouse management and management reporting apps.

TECHNICAL SKILLS

- **Mobile Development:** Flutter, Dart — cross-platform apps published on App Store & Google Play
- **Backend:** NestJS, Prisma, Node.js — REST API design, WebSockets (Socket.IO), scheduled jobs
- **Frontend:** React, Next.js, TypeScript
- **Databases:** PostgreSQL, SQL Server, MySQL, Redis, Firebase
- **Systems & Integration:** Automated ERP synchronization, payment gateways (HyperPay — Mada, Visa, Apple Pay), biometric attendance devices (ZKTeco), data migration
- **Admin Panels:** Laravel / Filament, Docker, Sentry, New Relic, Prometheus
- **Tools & Practices:** Git & GitHub, VS Code, Android Studio, Agile teamwork

PROFESSIONAL EXPERIENCE

2025 – Present

Software Engineer — Al-Monafiss Stores (Monafiss), Jeddah, Saudi Arabia

- Sole software engineer on the platform: develop and maintain Monafiss Market, an on-demand grocery-delivery app (35–50 min delivery) carrying 750-1,000 orders a day at an average basket of SAR 177.89, published on the App Store and Google Play and now at build 151 — 38 feature modules including a VR shopping aisle, an AI assistant that parses written shopping lists, in-app voice and video calls over LiveKit, shared baskets and family accounts, a loyalty programme and a wallet with automatic refunds, with HyperPay checkout (Mada, Visa, Apple Pay) and live driver tracking on the map; shipping weekly updates.
- Built and published Monafiss Driver — order dispatch, live GPS tracking, barcode scanning, proof-of-delivery photos, return pickups and a courier earnings view — and the in-store fulfilment (picking) app with its own Express and Socket.IO backend, plus a centralized Next.js dashboard that runs the whole operation from one place.
- Designed and built an automated ERP synchronization service that moves offers, prices and inventory from the company's SQL Server ERP into the apps' PostgreSQL on a configurable, per-branch schedule — validating every batch against business rules and holding dangerous changes for manual review before they reach customers.
- Built a four-service accounting, HR and payroll system covering the sales and purchase cycle, stock movements posted to the general ledger, a pricing engine and payroll — reading attendance straight off ZKTeco fingerprint terminals.
- Implemented warehouse management, delivery zones and ETA, loyalty, returns and refunds, in-app messaging, fleet management and a reporting suite across a backend of 72 modules over 105 data models.
- Leading an ongoing ERP data migration from the company's legacy system to a newly adopted ERP.
- Released "Roeya", an internal reporting app distributed privately to company managers — live analytics as charts, PDF export and printing, biometric unlock and a home-screen summary widget.

Jan 2025 – Mar 2025

Application Developer — The Hope International, Jordan

- Developed and maintained cross-platform mobile applications using Flutter (Dart).
- Designed responsive interfaces and implemented efficient navigation and state management.
- Integrated RESTful APIs to connect apps with backend services for smooth data flow.
- Collaborated with designers and backend developers; participated in testing, debugging, and deployment on Android and iOS.

Lahza Etar — Published iOS App (2026)

- A store for home decor and 3D-printed figurines, published on the App Store under my own developer account. Customers buy from the catalogue or send their own file or idea, receive a quote and pay only after approving it; orders are tracked on the iPhone Lock Screen without opening the app, and checkout takes cash on delivery, card or Apple Pay. Behind it: a NestJS API of 24 modules over 72 data models, a React operations dashboard, a finance module with landed-cost shipments and VAT, and geospatial delivery zones on PostGIS. Designed and built end to end.

IT Support System (2026, in development)

- An internal ticketing system that replaces a scattered IT desk with one channel. Requests are filed through a three-level tree — system, component, problem type — where each leaf has its own dynamic form with required fields, so an incomplete ticket is rejected before a technician reads it. Adds business-hours SLA deadlines with early warning and automatic escalation, scoped custom roles, and management reports on recurring problems and technician performance. 24 API modules over 49 data models.

Rona — AI Personal Assistant (2026, TestFlight)

- An autonomous assistant that works inside WhatsApp and answers in Arabic, with an iOS companion app. 21k lines of TypeScript and 83 tools sit behind a permission engine of 100 policies that decides what runs unattended and what waits for approval; text from third parties is summarised by a tool-less model, so an instruction hidden in an incoming message cannot trigger an action. Covered by 42 security tests.

Etar — Published iOS App (2025)

- A booking platform for event photographers and service providers, published on the App Store under my own developer account. Users browse providers, portfolios, and pricing, pay securely in-app, chat with providers, and manage bookings — backed by a dedicated admin dashboard. Designed and built end to end.

BuzzIt (2025)

- Barber appointment booking app with streamlined service selection and scheduling.

Daily Task Manager (2025)

- Task management app with reminders, priorities, and a points-based motivation system.

EDUCATION

2025

B.Sc. in Software Engineering — Philadelphia University, Jordan

COURSES & LANGUAGES

- Courses: Flutter Mobile Development (32h), Flutter 101 & 102, Dart 101–103, SQL.
- Languages: Arabic (Native), English (Conversational).
